

Rack Gizmo Wiring Diagram

Rack Gizmo Wiring Diagram

4 pedals in front of the amp, 4 pedals in the amp's loop, tuner

The guitar signal passes from the front panel jack, through the buffer, then through the first 4 audio loops, through the Click Stopper circuit and into the amp's input.

The last four loops are inserted into the amp's effects loop. These can be either pedals or rack units, but be sure to make sure the signal levels match between effects and the amp.

The Rack Gizmo controls channel switching on the amp using one of the function switching jacks.
